

Does a battery have a memory effect?

The memory effect is observed in (rechargeable) nickel-cadmium and nickel-metal hybrid batteries. Yet, the genuine memory effect occurs only on rare occasions. More often than not, a battery will show effects that are merely similar to the 'real' memory effect. What is the main distinction?

Do different battery chemistries have different memory effects?

Different battery chemistries have different memory effects. Image adapted from: Have you noticed your rechargeable batteries don't seem to last as long as they did when they were new? This memory effect occurs in some rechargeable batteries when you don't sufficiently discharge them before recharging.

What is battery memory?

Battery memory is a largely misunderstood phenomenon that does not apply to modern rechargeable batteries, such as NiMH and Li-ion batteries. While capacity fade and performance degradation are inevitable aspects of battery use, they are not caused by incomplete discharge and recharge cycles.

What is the memory effect of a rechargeable battery?

This memory effect occurs in some rechargeable batteries when you don't sufficiently discharge them before recharging. The batteries then 'remember' where they were up to in earlier discharge cycles and won't recharge fully. Many cordless drill users will be familiar with the dreaded memory effect of Ni-Cad batteries.

Do lithium batteries have memory effects?

Phenomena which are not true memory effects may also occur in battery types other than sintered-plate nickel-cadmium cells. In particular, lithium-based cells, not normally subject to the memory effect, may change their voltage levels so that a virtual decrease of capacity may be perceived by the battery control system.

Why do batteries have bad memories?

Over time, the imperfections in one charge cycle can cause the same in the next charge cycle, and so on, and our battery picks up some bad memories. The memory effect is strong for some types of cells, such as nickel-based batteries. Other types, like lithium-ion, don't suffer from this problem.
