

What is the Yemen integrated urban services emergency project?

The Yemen Integrated Urban Services Emergency Project, covering 16 urban areas, rehabilitated a water system and 113 wells, providing more than 1.1 million people with access to water and sanitation. The project also installed eight solar photovoltaic (PV) systems for municipal water wells and 40 solar PV systems for rural communities' water wells.

How can the international community help address the water crisis in Yemen?

Addressing the water crisis in Yemen will require significant investment in water infrastructure, sustainable water management practices, and political stability. The international community has a vital role to play in supporting Yemen in addressing its water crisis and in resolving the ongoing conflict.

How has Yemen impacted water infrastructure?

Already a water-scarce region, the six-year conflict in Yemen has severely impacted the country's water infrastructure, leaving 18 million people in urgent need of WASH assistance (UN).

How many Yemeni people have access to improved water?

In 2011, the United Nations' Joint Monitoring Programme for Water Supply and Sanitation estimated that only 55% of the Yemeni population had access to improved water source - including 40% from house connections and 15% from other improved water sources such as standpipes. Only 53% had access to improved sanitation.

What is the biggest water project in Yemen?

Now, we are launching our biggest ever water project in Yemen, which will provide 1.7 million people in the Aden and Lahj Governorates with clean water piped directly into their homes. We aim to complete this project by July 2021, but we need your help.

Why is Yemen a water crisis?

Yemen is considered one of the world's most water-scarce countries. About 18 million people lack access to safe water and sanitation, and providing drinking water will likely be one of the biggest problems that people will encounter in coming years. Complicating the issue is the fact that conflict has had a severe impact on water infrastructure.
